The present invention relates to prostanoid acid derivatives as potent ocular hypotensives that are particularly suited for the management of glaucoma.

### **Background of the Invention**

### **Description of Related Art**

Ocular hypotensive agents are useful in the treatment of a number of various ocular hypertensive conditions, such as post-surgical and post-laser trabeculectomy ocular hypertensive episodes, glaucoma, and as presurgical adjuncts.

Glaucoma is a disease of the eye characterized by increased intraocular pressure. On the basis of its etiology, glaucoma has been classified as primary or secondary. For example, primary glaucoma in adults (congenital glaucoma) may be either open-angle or acute or chronic angle-closure. Secondary glaucoma results from pre-existing ocular diseases such as uveitis, intraocular tumor or an enlarged cataract.

The underlying causes of primary glaucoma are not yet known. The increased intraocular tension is due to the obstruction of aqueous humor outflow. In chronic open-angle glaucoma, the anterior chamber and its anatomic structures appear normal, but drainage of the aqueous humor is impeded. In acute or chronic angle-closure glaucoma, the anterior chamber is shallow, the filtration angle is narrowed, and the iris may obstruct the trabecular meshwork at the entrance of the canal of Schlemm. Dilation of the pupil may push the root of the iris forward against the angle, and may produce pupillary block and thus precipitate an acute attack. Eyes with narrow anterior chamber angles are predisposed to acute angle-closure glaucoma attacks of various degrees of severity.

Secondary glaucoma is caused by any interference with the flow of aqueous humor from the posterior chamber into the anterior chamber and subsequently, into the canal of Schlemm. Inflammatory disease of the anterior segment may prevent aqueous escape by causing complete posterior synechia in  
5 iris bombe, and may plug the drainage channel with exudates. Other common causes are intraocular tumors, enlarged cataracts, central retinal vein occlusion, trauma to the eye, operative procedures and intraocular hemorrhage.

Considering all types together, glaucoma occurs in about 2% of all persons over the age of 40 and may be asymptotic for years before progressing to  
10 rapid loss of vision. In cases where surgery is not indicated, topical  $\beta$ -adrenoreceptor antagonists have traditionally been the drugs of choice for treating glaucoma.

Certain eicosanoids and their derivatives have been reported to possess ocular hypotensive activity, and have been recommended for use in glaucoma  
15 management. Eicosanoids and derivatives include numerous biologically important compounds such as prostaglandins and their derivatives. Prostaglandins can be described as derivatives of prostanoic acid which have the following structural formula:

Various types of prostaglandins are known, depending on the structure and substituents carried on the alicyclic ring of the prostanoic acid skeleton. Further classification is based on the number of unsaturated bonds in the side chain indicated by numerical subscripts after the generic type of prostaglandin  
25 [e.g. prostaglandin E<sub>1</sub> (PGE<sub>1</sub>), prostaglandin E<sub>2</sub> (PGE<sub>2</sub>)], and on the

configuration of the substituents on the alicyclic ring indicated by  $\alpha$  or  $\beta$  [e.g. prostaglandin  $F_{2\alpha}$  ( $PGF_{2\beta}$ )].

Prostaglandins were earlier regarded as potent ocular hypertensives, however, evidence accumulated in the last decade shows that some  
5 prostaglandins are highly effective ocular hypotensive agents, and are ideally suited for the long-term medical management of glaucoma (see, for example, Bito, L.Z. Biological Protection with Prostaglandins, Cohen, M.M., ed., Boca Raton, Fla, CRC Press Inc., 1985, pp. 231-252; and Bito, L.Z., Applied Pharmacology in the Medical Treatment of Glaucomas Drance, S.M. and  
10 Neufeld, A.H. eds., New York, Grune & Stratton, 1984, pp. 477-505. Such prostaglandins include  $PGF_{2\alpha}$ ,  $PGF_{1\alpha}$ ,  $PGE_2$ , and certain lipid-soluble esters, such as  $C_1$  to  $C_2$  alkyl esters, e.g. 1-isopropyl ester, of such compounds.

Although the precise mechanism is not yet known experimental results indicate that the prostaglandin-induced reduction in intraocular pressure results  
15 from increased uveoscleral outflow [Nilsson et. al., Invest. Ophthalmol. Vis. Sci. (suppl), 284 (1987)].

The isopropyl ester of  $PGF_{2\alpha}$  has been shown to have significantly greater hypotensive potency than the parent compound, presumably as a result of its more effective penetration through the cornea. In 1987, this compound was  
20 described as "the most potent ocular hypotensive agent ever reported" [see, for example, Bito, L.Z., Arch. Ophthalmol. 105, 1036 (1987), and Siebold et al., Prodrug 5 3 (1989)].

Whereas prostaglandins appear to be devoid of significant intraocular side effects, ocular surface (conjunctival) hyperemia and foreign-body sensation have  
25 been consistently associated with the topical ocular use of such compounds, in particular  $PGF_{2\alpha}$  and its prodrugs, e.g., its 1-isopropyl ester, in humans. The clinical potentials of prostaglandins in the management of conditions associated with increased ocular pressure, e.g. glaucoma are greatly limited by these side effects.

30 In a series of co-pending United States patent applications assigned to Allergan, Inc. prostaglandin esters with increased ocular hypotensive activity

accompanied with no or substantially reduced side-effects are disclosed. The co-pending USSN 596,430 (filed 10 October 1990, now U.S. Patent 5,446,041), relates to certain 11-acyl-prostaglandins, such as 11-pivaloyl, 11-acetyl, 11-isobutyryl, 11-valeryl, and 11-isovaleryl PGF<sub>2</sub> $\alpha$ . Intraocular pressure reducing  
5 15-acyl prostaglandins are disclosed in the co-pending application USSN 175,476 (filed 29 December 1993). Similarly, 11,15- 9,15 and 9,11-diesters of prostaglandins, for example 11,15-dipivaloyl PGF<sub>2</sub> $\alpha$  are known to have ocular hypotensive activity. See the co-pending patent applications USSN Nos. 385,645 (filed 07 July 1989, now U.S. Patent 4,994,274), 584,370 (filed 18 September  
10 1990, now U.S. Patent 5,028,624) and 585,284 (filed 18 September 1990, now U.S. Patent 5,034,413). Recently, we have also shown that 17-naphthyl and benzothienyl prostaglandin compounds also have ocular hypotensive activity (USSN 859,770, filed 17 May 2001). The disclosures of all of these patent applications are hereby expressly incorporated by reference.

15 Certain 15,15-dimethyl prostaglandins with antihypertensive, gastric acid secretion inhibition, and smooth muscle stimulant properties, are known to have improved metabolic stability. These are described by Pernet *et al* in US Patent 4,117,014 (filed 23 December 1976), the disclosure of which is hereby expressly incorporated by reference.

Another preferred group includes compounds having formula III:

5

**Formula III**

Another preferred group includes compounds having formula IV:

**Formula IV**

Another preferred group includes compounds having formula V:

**Formula V**

wherein at least one of  $R^2$  and  $R^3$  is not methyl.

In the above formulae, the substituents and symbols are as hereinabove defined.

In the above formulae:

- 5            Preferably Y is any pharmaceutically acceptable salt of  $CO_2H$  or  $CO_2R$ .

20

In another aspect of this invention, certain elements of the method making the compounds of the invention are novel and unobvious. One such novel and unobvious element is the application of the use of Baker's yeast as a reducing agent as reported by Brooks and coworkers (Brooks, *et. al.*,

- 25            "Asymmetric Microbial Reduction of Prochiral 2,2-Disubstituted

Cycloalkanediones", *J. Org. Chem.*, **1987**, 52, 3223-3232) in the synthesis of compounds of this invention. In this novel and unobvious application of this reaction, Baker's yeast is used to carry out an asymmetric reduction of a compound of formula VII, which is a 2,2-dialkylcyclopentane-1,3-dione, to a  
5 compound of formula VIII, which is a 2,2-dialkyl-3(S)-hydroxycyclopentanone. A compound of formula VIII is then used to prepare compounds of this invention.

**Formula VI****Formula VII**

The two alkyl groups,  $R^2$  and  $R^3$  of the compounds of formula VI and VII, in  
10 this reaction are the same as those defined for compounds of Formula I above. In the case where the two alkyl groups are different, a mixture of diastereomers is formed, which can be separated by conventional separation methods to obtain the enantiomerically pure products.

Preparation of 2,2-dialkylcyclopentan-1,3-diones is well known in the  
15 art. One convenient way that a large variety of these compounds can be prepared is by base-mediated alkylation of carbon-2 of the cyclopentane-1,3-dione using an alkyl halide or equivalent compound. This type of reaction is well known in the art. The preparation of three general types of 2,2-dialkylcyclopentan-1,3-diones using this alkylation reaction is illustrated in  
20 Scheme 1. Compounds where one of the alkyl groups is methyl can be prepared by a simple alkylation reaction from commercially available 2-methylcyclopentan-1,3-dione **1** (Equation 1). In the case neither of the alkyl groups in the 2,2-dialkylcyclopentan-1,3-dione are methyl (compound **2b**), these compounds can be prepared from cyclopentan-1,3-dione by two consecutive  
25 alkylation reactions (Equation 2). In the case where the two alkyl groups in the 2,2-dialkylcyclopentan-1,3-dione are the same, these alkylation reactions can be

carried out in a one-pot procedure. In the case where the two alkyl groups to form a cyclic compound incorporating C<sub>2</sub> of the cyclopentanone into the ring, otherwise known as a spiroketone, these compounds can be prepared by using a dihaloalkane or equivalent compound to carry out an intermolecular alkylation followed by an intramolecular alkylation (Equation 3), which could be carried out in a one or two pot process. Those skilled in the art will recognize that there are many ways to prepare 2,2-dialkylcyclopentan-1,3-diones, and the reactions of Scheme 1 are included to illustrate that these compounds can be readily prepared or obtained by those skilled in the art, and are not intended to limit the scope of the invention in any way.

In another novel and unobvious aspect of this invention, compounds of the invention represented by Formula VIII are prepared by a process that comprises the following steps:

**Formula VIII**

- 15 i) reacting a compound of Formula IX with a compound of Formula X in the presence of a suitable base to form a compound of Formula XI;

**Formula IX**

**Formula X**

12

**Formula XI**

ii) coupling a compound of Formula XI with a compound of Formula XII; and

**Formula XII**

5           iii) removing the protecting groups and separating the diastereomers to obtain the desired products;

wherein the hatched wedges indicate the  $\alpha$  (down) configuration, the solid triangles indicate the  $\beta$  (up) configuration, and the wavy lines indicate either the cis (Z) or trans (Z) conformation;

10          n is 0-6;

B is a single, double, or triple covalent bond;

J is a protecting group that can be easily removed to form the respective hydroxide group without affecting the rest of the molecule;

R is  $C_{1-6}$  alkyl or  $C_{2-6}$  alkenyl;

15           $R^2$  and  $R^3$  are  $C_{1-6}$  linear alkyl which may be the same or different, and may be bonded to each other such that they form a ring incorporating the carbon to which they are commonly attached;

X is S or O; and

M is a group that comprises one or more metal atoms.

20          All of the compounds encompassed by this invention can be prepared using the methods described above supplemented by methods known to those skilled in the art. The synthesis of several compounds of the invention is illustrated in

Schemes 2-7. These Schemes that are included herein are merely illustrative and are not intended to limit the scope of the invention in any way. Although there are several ways the reduction of compounds of Formula VI to Formula VII could be incorporated into the synthesis of these compounds, one

5 convenient way to this is shown in Scheme 2. In this Scheme, compound **2** is a compound of Formula VI and compound **3** is a compound of formula VII. However, those skilled in the art will recognize that there are many ways in which the reduction could be used to prepare compounds of this invention.

52, 3223) A 35 °C (internal temperature) solution of D-glucose (106.73 g, 592 mmol, Aldrich) in H<sub>2</sub>O (690 mL) in a 4 L Erlenmeyer was treated with baker's yeast (71.065 g, Fleischmann's). The mixture was allowed to ferment for 2 h, then 2,2-dimethyl-cyclopentane-1,3-dione (**2**) (7.316 g, 58 mmol) was added.

5

The mixture was stirred for 48 h and then filtered through celite, washing with about 1 L CH<sub>2</sub>Cl<sub>2</sub>. The filtration was difficult due to the thick consistency of the yeast and it helped to continually add CH<sub>2</sub>Cl<sub>2</sub> to the mixture and scrape the top of the celite layer with a spatula. The filtrate was transferred to a separatory funnel, and 100 mL brine was added and the layers were separated. Brine (400 mL) was added to the aqueous layer and the resulting solution extracted further with CH<sub>2</sub>Cl<sub>2</sub> (3 x 500 mL). The combined CH<sub>2</sub>Cl<sub>2</sub> solution was dried (MgSO<sub>4</sub>), filtered and evaporated to leave a yellow oil. Flash chromatography (11 x 5 cm, 20% EtOAc/hexs → 25% → 30% → 40% → 50%) gave alcohol **3** (2.435 g, 19 mmol, 33%).

15

The enantiomeric excess of **3** was assayed by <sup>1</sup>H NMR of the corresponding Mosher's ester which was prepared by treatment of alcohol **3** (11 mg, 0.09 mmol) in dichloroethane (0.3 mL, Aldrich) with pyridine (27 μL, 0.33 mmol, Aldrich) and (*R*)-α-methoxy-α-trifluoromethylphenylacetic acid chloride (58 μL, 0.31 mmol, Fluka). The mixture was stirred overnight and then partitioned between water (10 mL) and ether (10 mL). The ether layer was washed with 1 M HCl (10 mL) and saturated NaHCO<sub>3</sub> solution and then was dried (MgSO<sub>4</sub>), filtered and evaporated. <sup>1</sup>H NMR analysis was done on the crude ester.

After 5.5 h, saturated NaHCO<sub>3</sub> solution (20 mL) was added and  
5 the mixture extracted with CH<sub>2</sub>Cl<sub>2</sub> (20 mL). The CH<sub>2</sub>Cl<sub>2</sub> solution was washed with 20 mL each of 1 M HCl, saturated NaHCO<sub>3</sub> solution, and brine and then was dried (MgSO<sub>4</sub>), filtered and evaporated. The mixture was stirred overnight and then 10 mL 0.5 M HCl was added along with a few mL's of brine. The mixture was extracted with ethyl acetate (3 x 10 mL) and the combined ethyl acetate solution dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and evaporated. Purification by flash chromatography on silica gel (3-5% MeOH/CH<sub>2</sub>Cl<sub>2</sub>) gave 4 mg (0.0078 mmol, 37%) of the acid (**23**). 300 MHz <sup>1</sup>H NMR (CDCl<sub>3</sub>, ppm)  $\delta$  7.73 (2 H, d,  $J$  = 8.4 Hz) 7.4-7.3 (2 H, m) 5.9-5.8 (1 H, m) 5.8-5.7 (1 H, m) 4.4-4.3 (1 H, m) 3.63 (1 H, d,  $J$  = 9.7 Hz) 3.21 (2 H, s) 3.1-2.4 (11 H, overlapping m) 2.1-1.7 (4 H, overlapping m) 1.12 (3 H, s) 1.03 (3 H, s).

The higher  $R_f$  ester was hydrolyzed similarly except a solution of rabbit liver esterase (10 mg) in 0.5 mL of pH 7.2 phosphate buffer was added to a solution of the ester (10 mg, 0.019 mmol) in CH<sub>3</sub>CN (0.2 mL). The reaction was stirred for 22 h and then worked up and purified as above. This gave 7 mg (0.013 mmol, 71%) of the acid (**24**). 300 MHz <sup>1</sup>H NMR (CDCl<sub>3</sub>, ppm)  $\delta$  7.73 (2 H, d,  $J$  = 8.8 Hz) 7.44-7.31 (2 H, m) 5.9-5.8 (1 H, m) 5.8-5.7 (1 H, m) 4.4-4.3 (1 H, m) 3.64 (1 H, d,  $J$  = 9.7 Hz) 3.3-2.3 (13 H, overlapping m) 2.1-1.7 (4 H, overlapping m) 1.12 (3 H, s) 1.03 (3 H, s).

**7-(*tert*-Butyl-dimethyl-silanyloxy)-hept-2-yn-1-ol (27).**

**Acetic acid 7-(*tert*-butyl-dimethyl-silanyloxy)-hept-2-ynyl ester (28).** A

solution of 7-(*tert*-Butyl-dimethyl-silanyloxy)-hept-2-yn-1-ol **27** (4.507 g, 21 mmol) in pyridine (20 mL) was treated with acetic anhydride (3.0 mL, 31.8 mmol). After 18 h, the solvent was evaporated and the residue co-evaporated with toluene. The residue was used directly in the next step.

**7-Acetoxy-hept-5-ynoic acid (29).** A solution of crude **28** in acetone (100 mL) was treated with Jones Reagent (18.0 mL, 41.4 mmol, 2.3 M). The mixture became warm and so was cooled with an ice bath. After 1 h at room

temperature, 10 mL isopropyl alcohol was added and the mixture stirred further for 15 min. The mixture still had a brown color so another 10 mL isopropyl alcohol was added. After another 15 min., the color had not changed so the mixture was filtered through celite and the filtrate evaporated in vacuo. The residue was partitioned between 100 mL ether and 100 mL saturated ammonium chloride solution. The aqueous layer was extracted with 100 mL ether and the combined ether solution washed with brine and then was dried (MgSO<sub>4</sub>), filtered and evaporated to leave a yellow oil (6.333 g) that was used directly in the next step.

**7-Hydroxy-hept-5-ynoic acid methyl ester (30).** The crude acid **29** (6.333 g) was treated with a 1% solution of acetyl chloride in methanol (60 mL). After 16 h, sodium bicarbonate (1.966 g, 23.4 mmol) was added. The mixture was dried (MgSO<sub>4</sub>), filtered through celite and evaporated in vacuo. Purification by flash chromatography on silica gel (30-40% ethyl acetate/hexanes) gave 7-Hydroxy-

hept-5-ynoic acid methyl ester **30** (3.022 g, 19.3 mmol, 92% from 7-(*tert*-Butyl-dimethyl-silanyloxy)-hept-2-yn-1-ol **27**).

**7-Iodo-hept-5-ynoic acid methyl ester (31).** A solution of **30** (1.347 g, 8.6 mmol) in 5 mL dichloromethane was added to a mixture of triphenylphosphine  
5 (2.725 g, 10.4 mmol), imidazole (726 mg, 10.7 mmol), and iodine (2.602 g, 10.3 mmol) in 34 mL dichloromethane, rinsing with 5 mL dichloromethane. After 40 min., the dichloromethane was evaporated in vacuo to a few mL's and the resulting mixture filtered through basic alumina, washing with 10% ethyl acetate/hexanes. Purification by flash chromatography on silica gel (10% ethyl  
10 acetate/hexanes) gave 1.878 g (7.1 mmol, 83%) of the propargyl iodide.

***tert*-Butyl-[(*E*)-1-[2-(3-chloro-benzo[b]thiophen-2-yl)-ethyl]-3-iodo-allyloxy]-dimethyl-silane (32).** A solution of alkyne **19** (5.547 g, 15.2 mmol) in dichloromethane (50 mL) was treated with Cp<sub>2</sub>ZrHCl (5.794 g, 22.5 mmol). The reaction was stirred for 45 min. and then N-iodosuccinimide (4.966 g, 22.1  
15 mmol) was added. After 15 min., saturated sodium bicarbonate solution (200 mL) was added and the mixture was extracted with dichloromethane (2 x 100 mL). The combined dichloromethane solution was dried (MgSO<sub>4</sub>), filtered and evaporated. Purification by flash chromatography on silica gel (0-5% ethyl acetate/hexanes) gave 6.608 g (13.1 mmol, 86%) of the vinyl iodide (**32**).

The dark red mixture was

stirred for 25 min. and then dimethylzinc (0.80 mL, 1.6 mmol, 2 M/toluene) was added. The solution was stirred at 0 °C for 15 min. and then recooled to -78 °C. At this time, a solution of enone **6** (208 mg, 0.87 mmol) in THF (1.0 mL) was added over 2 h by syringe pump, rinsing with 0.5 mL THF. After 30 min.,

5 HMPA (1.34 mL, distilled from CaH<sub>2</sub>) was added followed by a solution of propargyl iodide **31** (1.286 g, 4.83 mmol) in THF (1.0 mL). The solution was stirred in a -40 °C bath overnight and then 20 mL saturated ammonium chloride solution and 10 mL water were added. The mixture was extracted with dichloromethane (20 mL) and ethyl acetate (2 x 20 mL). The combined organic

15 A solution of **33** (198 mg, 0.27 mmol) in CH<sub>3</sub>CN (6.5 mL) was treated with HF-pyridine (1.2 mL). The solution was stirred for 3 h and saturated sodium bicarbonate solution (120 mL) was added. The mixture was extracted with dichloromethane (3 x 50 mL) and the combined dichloromethane solution dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and evaporated. Purification by flash

20 chromatography (50% ethyl acetate/hexane) followed by preparative TLC (55% ethyl acetate/hexane) gave 55 mg (0.11 mmol, 41%) of the less polar diastereomer (**34**) and 51 mg (0.10 mmol, 37%) of the more polar diastereomer (**35**).

A solution of **34** (9 mg, 0.017 mmol) and rabbit liver esterase (1 mg) in pH 7.2 phosphate buffer (2 mL)/CH<sub>3</sub>CN (0.1 mL) was stirred for 17 h. The mixture was then coevaporated with CH<sub>3</sub>CN to remove water and the residue purified by flash chromatography on silica gel (3-7% MeOH/CH<sub>2</sub>Cl<sub>2</sub>) to give 8 mg (0.016 mmol, 93%) of the acid (**36**).

A solution of **35** (12 mg, 0.023 mmol) and rabbit liver esterase (1 mg) in pH 7.2 phosphate buffer (2 mL)/CH<sub>3</sub>CN (0.1 mL) was stirred for 17 h. TLC showed the presence of starting material, so another 2 mg of the esterase was added. After stirring for another 24 h, the reaction was complete. Work up and purification as above for **36** gave 8 mg (0.016 mmol, 69%) of the acid (**37**).

(*Z*)-7-[(1*R*,4*S*,5*R*)-5-[(*E*)-5-(3-chloro-benzo[*b*]thiophene-2-yl)-3-hydroxy-pent-1-enyl]-4-hydroxy-3,3-dimethyl-2-oxo-cyclopentyl]-hept-5-enoic acid methyl ester (low *R<sub>f</sub>* diastereomer, **38**). After stirring for 7 h, 2-aminoethanol (5  $\mu$ L, 0.083 mmol) was added and the mixture stirred further for 16 h. The methods of screening the compounds of this invention for the desired biological activity are illustrated in the following non-limiting examples. Results for example compounds of this invention are included in Table 2. These results are presented purely for illustrative purposes and are not intended to limit the scope of the invention in any way.

### **Radioligand Binding**

#### **Cells Stably Expressing EP<sub>1</sub>, EP<sub>2</sub>, EP<sub>4</sub> and FP Receptors**

HEK-293 cells stably expressing the human or feline FP receptor, or EP<sub>1</sub>, EP<sub>2</sub>, or EP<sub>4</sub> receptors were washed with TME buffer, scraped from the bottom of the flasks, and homogenized for 30 sec using a Brinkman PT 10/35 polytron. TME buffer was added to achieve a final 40 ml volume in the centrifuge tubes (the composition of TME is 100 mM TRIS base, 20 mM MgCl<sub>2</sub>, 2M EDTA; 10N HCl is added to achieve a pH of 7.4).

The cell homogenate was centrifuged at 19000 r.p.m. for 20 min at 4° C using a Beckman Ti-60 rotor. The resultant pellet was resuspended in TME buffer to give a final 1 mg/ml protein concentration, as determined by Biorad assay. Radioligand binding competition assays vs. [<sup>3</sup>H]-17-phenyl PGF<sub>2α</sub> (5 nM) were performed in a 100μl volume for 60 min. Binding reactions were started by adding plasma membrane fraction. The reaction was terminated by the addition of 4 ml ice-cold TRIS-HCl buffer and rapid filtration through glass fiber GF/B filters using a Brandel cell harvester. The filters were washed 3 times with ice-cold buffer and oven dried for one hour.

[<sup>3</sup>H]-PGE<sub>2</sub> (specific activity 180 Ci mmol) was used as the radioligand for EP receptors. [<sup>3</sup>H] 17-phenyl PGF<sub>2α</sub> was employed for FP receptor binding studies. Binding studies employing EP<sub>1</sub>, EP<sub>2</sub>, EP<sub>4</sub> and FP receptors were performed in duplicate in at least three separate experiments. A 200μl assay volume was used. Incubations were for 60 min at 25°C and were terminated by the addition of 4 ml of ice-cold 50 mM TRIS-HCl, followed by rapid filtration through Whatman GF/B filters and three additional 4 ml washes in a cell harvester (Brandel). Competition studies were performed using a final concentration of 5 nM [<sup>3</sup>H]-PGE<sub>2</sub>, or 5 nM [<sup>3</sup>H] 17-phenyl PGF<sub>2α</sub> and non-

specific binding determined with  $10^{-5}$ M of unlabeled PGE<sub>2</sub>, or 17-phenyl PGF<sub>2 $\alpha$</sub> , according to receptor subtype studied.

#### METHODS FOR FLIPR™ STUDIES

##### (a) CELL CULTURE

5 HEK-293(EBNA) cells, stably expressing one type or subtype of recombinant human prostaglandin receptors (prostaglandin receptors expressed: hDP/Gqs5; hEP<sub>1</sub>; hEP<sub>2</sub>/Gqs5; hEP<sub>3A</sub>/Gqi5; hEP<sub>4</sub>/Gqs5; hFP; hIP; hTP), were cultured in 100 mm culture dishes in high-glucose DMEM medium containing 10% fetal bovine serum, 2 mM l-glutamine, 250 µg/ml geneticin (G418) and  
10 200 µg/ml hygromycin B as selection markers, and 100 units/ml penicillin G, 100 µg/ml streptomycin and 0.25 µg/ml amphotericin B.

##### (b) CALCIUM SIGNAL STUDIES ON THE FLIPR™

Cells were seeded at a density of  $5 \times 10^4$  cells per well in Biocoat® Poly-D-lysine-coated black-wall, clear-bottom 96-well plates (Becton-Dickinson) and  
15 allowed to attach overnight in an incubator at 37 °C. Cells were then washed two times with HBSS-HEPES buffer (Hanks Balanced Salt Solution without bicarbonate and phenol red, 20 mM HEPES, pH 7.4) using a Denley Cellwash plate washer (Labsystems). After 45 minutes of dye-loading in the dark, using the calcium-sensitive dye Fluo-4 AM at a final concentration of 2 µM, plates  
20 were washed four times with HBSS-HEPES buffer to remove excess dye leaving 100 µl in each well. Plates were re-equilibrated to 37 °C for a few minutes.

Cells were excited with an Argon laser at 488 nm, and emission was measured through a 510-570 nm bandwidth emission filter (FLIPR™,  
25 Molecular Devices, Sunnyvale, CA). Drug solution was added in a 50 µl volume to each well to give the desired final concentration. The peak increase in fluorescence intensity was recorded for each well. On each plate, four wells each served as negative (HBSS-HEPES buffer) and positive controls (standard agonists: BW245C (hDP); PGE<sub>2</sub> (hEP<sub>1</sub>; hEP<sub>2</sub>/Gqs5; hEP<sub>3A</sub>/Gqi5; hEP<sub>4</sub>/Gqs5);  
30 PGF<sub>2 $\alpha$</sub>  (hFP); carbacyclin (hIP); U-46619 (hTP), depending on receptor). The

peak fluorescence change in each drug-containing well was then expressed relative to the controls.

Compounds were tested in a high-throughput (HTS) or concentration-response (CoRe) format. In the HTS format, forty-four compounds per plate were examined in duplicates at a concentration of  $10^{-5}$  M. To generate concentration-response curves, four compounds per plate were tested in duplicates in a concentration range between  $10^{-5}$  and  $10^{-11}$  M. The duplicate values were averaged. In either, HTS or CoRe format each compound was tested on at least 3 separate plates using cells from different passages to give an  $n \geq 3$ .
